# Reclamite™ Rejuvenating Emulsion Project

## Pavement Preservation: City of Warsaw 2016

Preserving Roads.

**REJUVTEC**

Conserving Budgets.

**Reclamite™** Pavement Preservation Road Projects will begin week of July 25<sup>th</sup> and will be completed within two weeks (weather permitting). Work hours are from 7am – 5pm.

**Reclamite™** is a petroleum maltene rejuvenating emulsion that restores the original asphalt binder back to its proper balance, improves flexibility, reduces cracking and potholes, reduces road fatigue, and slows the oxidation process. This penetrating surface densification process is designed to extend the life of newly constructed pavement, and for corrective maintenance on deteriorated pavements to preserve roads in their current condition, delaying deterioration and more costly treatments.

Residents will be notified of rejuvenation work with door hangers. An applicator truck sprays the **Reclamite™** on the asphalt surface. The emulsion goes down pink and penetrates into the asphalt in about 15-30 minutes depending on temperature and other factors. A light coating of sand is then applied to absorb any material left-over and reduce tracking of the material. Although odorless, during the application process, pets and children should not be allowed on the street. All vehicles, traffic and parked cars must be off the streets that will be treated by 7am. The contractor will close the section of the street to apply the rejuvenator with a fog seal application. **Reclamite™** will temporarily darken the pavement. If residue gets on driveways, wash it with soap and water or it will wear off in two to six weeks. If residue gets on a vehicle, wash it with soap and water or use a bug or tar remover, WD-40 ETC.

**Reclamite™ Application Process:**

- Traffic and all parked vehicles must be off the scheduled roadway by 7:00am.
- The contractor will close the section of the road to apply the Reclamite™ treatment.
- Sand will be applied and the road will then be cleared for traffic. Do not drive on the road until after the sand has been applied because the road will be slick and oil can get on vehicles.
- To reduce the chance of residue on vehicles, keep speed to a minimum (15 mph) for several days
- In case of inclement weather or water on the roads, worked scheduled for that day will be moved to the end of the schedule. Door hangers will be hung on doors to designate work days.
- Please check the City of Warsaw website or Facebook page for updates.
- For additional questions please contact: Public Works (574-372-9561)
